## TEN EASY STEPS FOR OIL RESIDUE REMOVAL

Shake Oil Shift and pour over area

Stand on the pads to maximise absorption

Scrub Oil Shift into surface with deck brush provided

Place used absorbents in disposal bag

Leave for thirty minutes to allow biological action to take effect (see stage 4)

Wet and scrub area then soak up residues with remaining pads

Add a little water during stage 3 to prevent drying

Use sweeping compound to absorb liquid from indentations

Absorb oily liquor with half of the absorbent pads provided

Sweep up all remaining absorbents and allow to dry

N.B. Dried residue may require more than one application.

Engine oil residue may leave carbon deposits produced during combustion. These will gradually oxidise over time.

Cleaning oil residues from asphalt will remove oxidised surface layer exposing original black asphalt.

This is not staining and will re-oxidise over time.

\*Water not included - approximately 5 Litres are required for 2.5 metres of residue

# The Control of Pollution (Oil Storage) (England) Regulations 2001 ARE YOU LEGAL?

Salisbury Industries 2001 No. 2664

**From September 1<sup>st</sup> 2005 it will be mandatory to comply**

- **Time Scale:** The above regulations came into effect during 2001 and have now become law. From September 1<sup>st</sup> 2005 it will be mandatory to comply with the regulations, even if no spill occurrence has been reported.
- **Scope:** The regulations cover all commercial and institutional businesses storing oil above ground in quantities over 200 litres in any type of container – (25litre drum, 205litre drum, IBC or tank). Oil means any kind of oil and fuel.
- **Requirements:** All oil containers must be stored in a bunded area or on a drip tray (sump pallet). This is mandatory and it is an offence not to comply. In their present form, the regulations require drums to be stored on a drip tray with a minimum sump capacity of 25% of the total volume stored, or 110% of the largest container stored, whichever is the greater.
